Annual Report, 2007-2008

Job II-A: Kill Studies of Deer on Alabama Wildlife Management Areas

Study Leader: Christopher W. Cook

Objective: To measure, record, and evaluate the deer harvest on Alabama Wildlife Management Areas.

Procedures: Project personnel recorded hunter participation and success on each of the 35 wildlife management areas (WMAs) and 16 physically disabled hunting areas (DHAs) having deer hunting during the 2007-08 season. Deer were examined and records were made of their sex, age, weight, and antler development when possible. Portions of this information were compiled and computed by project cooperators and submitted to the project leader for further analysis.

Discussion:

Hunter Participation and Success:

The number of deer killed on each WMA, the hunting method, and the man-days of participation are compared in Table I. The figures in Tables I through X are considered estimates since season permits are issued on many of the areas. Hunter participation and success may vary due to weather, date of hunt, and length of the season. To better understand overall trends, Table II and Tables V through VIII compare this past season's participation and success with an average of prior years, as well as last year, only for the WMAs offering deer hunting during the 2007-08 hunting season.

Participation in stalk hunts on the WMAs that offered stalk hunts during the 2007-08 hunting season decreased 2,041 man-days from last year's totals. Fourteen of the 26 WMAs offering stalk hunts this season had decreases in hunter man-days for stalk hunts. Hunter success also decreased, going from 16 man-days per deer killed in 2006-07 to 18 man-days per deer killed in 2007-08. This success rate still was better than the average of 20 man-days per deer killed for the period of 2001-06 on these same WMAs (Table II).

Eighteen WMAs scheduled either-sex deer hunts for youth hunters during the 2007-08 hunting season. Each hunter participating on one of these special hunts had to be less than 16 years of age and had to be accompanied by a non-hunting, licensed adult 25 years of age or older. Total participation on these hunts decreased from last year's total of 819 hunters to 718 hunters for 2007-08. The number of deer killed on these hunts decreased from 44 in 2006-07 to 33 for 2007-08. These totals (hunters and deer killed) are included in the stalk hunt totals in the following tables. The numbers for these hunts also are listed in Table III. The primary purpose of the youth hunts is to acquaint young hunters with deer hunting. These hunts will continue on WMAs where there is sufficient interest.

Twenty WMAs offered a total of 197 days of either-sex gun deer hunts (Table IV). One hundred ninety-three days of the 197 days of hunter's choice hunts were stalk hunt days. The remaining four days were dog hunt days. All of the hunts for the 2007-08 hunting season offered 100% either-sex opportunities. The chance to kill antlerless deer on the either-sex hunts greatly influences the hunter participation, number of deer killed, and hunter success levels shown in the stalk hunt totals (Tables I and II). Participation in either-sex stalk hunts was 64% of the total stalk hunt hunting effort and represented 71% of the total stalk hunt deer kill. The four days of either-sex dog hunts were 33% of the total dog hunt hunting effort and represented 48% of the total dog hunt deer kill. The hunter success rate for all either-sex hunts was one deer per 15.6 man-days of hunter effort, which was one

and one-half times higher than the success rate for the bucks only stalk hunts (one deer per 23.3 man-days of effort). Fifty-eight percent of the deer killed on the hunter's choice hunts were antlerless deer.

Participation in managed dog hunts increased slightly from the 2006-07 totals (Table V). Hunter success improved from last year, going from 23 man-days of hunting per deer killed in 2006-07 to 19 man-days per deer killed in 2007-08, and was higher than the 2001-05 average of 25 man-days per deer killed. Dog hunting participation was 6% of the total deer hunting effort on WMAs during the 2007-08 season and accounted for 5% of the total deer kill.

Archery hunting participation remained virtually unchanged from the previous year's totals on the 35 WMAs that offered archery hunting in the 2006-07 and 2007-08 hunting seasons (Table VI). Hunter success decreased from 15 man-days per deer killed during the 2006-07 hunting season to 17 man-days per deer killed during the 2007-08 season (Table VI). The success rate for 2007-08 was higher than the 2001-06 average of 27 man-days per deer killed. Archery hunting continues to provide a large portion of the hunting recreation on WMAs, representing 29% of the total deer hunting effort and 29% of the total deer kill.

Participation in primitive weapons (PW) hunts on the fifteen WMAs offering PW hunts during the 2006-07 and 2007-08 seasons increased slightly from 4,096 man-days to 4,155 man-days. The success rate on PW hunts decreased, going from 16 man-days per deer killed during the 2006-07 season to 18 man-days per deer killed for 2007-08 (Table VII). Participation on PW hunts represented 5% of the total deer hunting effort and 5% of the total deer killed on WMAs during the 2007-08 season.

The total hunting effort on the WMAs offering deer hunting during the 2007-08 seasons, as shown in Table VIII, showed a decrease of just over 1,600 man-days when compared to the 2006-07 totals for these same WMAs. This year's hunting

effort was just over 5,000 man-days below the average of the previous five years (2001-02 through 2005-06) for these same WMAs. This year's hunter success ratio of one deer killed per 18 man-days of effort for all deer hunts was lower than last year's (16 man-days per deer killed), but was higher than the previous five year average of 22 man-days per deer killed on these WMAs.

Hunting Pressure and Kill Per Square Mile:

Total man-days of deer hunting per square mile, as shown in Table IX, was highest on St. Clair, Lowndes, Riverton, Little River, Barbour, Demopolis, and Blue Spring WMAs, respectively. Total man-days of hunting per square mile was lowest on Seven-Mile Island (archery only), Black Warrior, William L. Holland & Mobile-Tensaw Delta, Coosa, Upper Delta, and the Jackson County Waterfowl Areas (archery only) WMAs, respectively. Stalk hunting made up the largest portion of total use per square mile on most areas (20 of 35). Archery hunts made up the largest portion of use per square mile on Demopolis, William L. Holland & Mobile-Tensaw Delta, the Jackson County Waterfowl Areas (archery only), Seven-Mile Island (archery only), Swan Creek & Mallard-Fox Creek (archery only), and Upper Delta WMAs. Dog hunts made up the largest portion of use on Blue Spring, Frank W. & Rob M. Boykin, and Scotch WMAs.

Most areas of Alabama can support a balanced deer kill (bucks and does) of ten or more deer per square mile annually, depending on habitat quality. Two WMAs achieved this level during the 2007-08 hunting season, mainly because of the limited amount of hunting pressure on most WMAs (Table X). St. Clair had the highest estimated number of deer killed per square mile (27.36), followed by Lowndes (12.26), Blue Spring (8.52), Sam R. Murphy (7.82), Barbour (7.70), Mulberry Fork (7.12), Demopolis (6.81), and Oakmulgee (6.73). William L. Holland & Mobile-Tensaw Delta had the lowest estimated number of deer killed per square mile (0.66), followed by Black Warrior (0.80), the Jackson County Waterfowl Areas

(2.16), Swan Creek & Mallard-Fox Creek (2.16), Perdido River (2.45), Upper Delta (2.48), Seven-Mile Island (2.67), and Freedom Hills (2.88).

Weights and Condition of Deer:

Average weights of deer within specific age classes are one of the best indicators of overall herd condition (Table XI). An average live weight under 95 pounds for 1-½ years old males (i.e., yearlings) can be an indicator of poor physical condition caused by insufficient nutrition, either from poor habitat, heavy competition for food from other deer, or both. Where the yearling males have an average body weight of 95 to 105 pounds on areas with good soils, there should be concern the deer population exceeds the capacity of the land to support the herd in good condition. The deer population should be reduced to a more healthy level in any situation where competition for food is the cause of low body weights in deer. Areas in Alabama with yearling males averaging above 110 pounds live weight usually are not carrying an excess of deer and efforts should be made to keep those populations at current levels. The severe drought endured by most of Alabama during the spring, summer, and fall of 2007 did not appear to have a dramatic impact on the physical condition of deer on the WMAs. Average yearling male body weights among all WMAs averaged 99 pounds for the 2007-08 hunting season, which is only slightly below the average for the 2006-07 season (101 pounds). Swan Creek & Mallard-Fox Creek (120 pounds) and Wolf Creek (117 pounds) were the only WMAs with average yearling male body weights that exceeded 110 pounds. Eight other WMAs reported average yearling male body weights between 100 and 110 pounds. Lauderdale (87 pounds), Frank W. & Rob M. Boykin (89 pounds), and Coosa (89 pounds) had average yearling male body weights less than 90 pounds.

Antler Development:

Antler development (number of points, main beam length, and inside spread) for all age classes of bucks was very good on some areas, such as Barbour, Black Warrior, Cahaba River, Covington, Freedom Hills, Hollins, the Jackson County Waterfowl Areas, Lauderdale, Mulberry Fork, Sam R. Murphy, Swan Creek & Mallard-Fox Creek, and Wolf Creek, but remains poor on others (Tables XII and XIII). In most situations, a high percentage of spikes in the yearling age class and a significant occurrence of spikes in the older age classes are a reflection of poor habitat conditions and/or an overcrowded population. The heavy harvest of yearling bucks on some WMAs prevents significant numbers of bucks from reaching the older age classes. This alone continues to limit the harvest of bucks 2-½ years old and older on these WMAs. Corrections to both nutritional deficiencies and buck age structure are necessary in order to bring about improvements in the quality of bucks harvested. However, on areas with poor soil fertility and/or habitat quality, reducing competition for food by reducing deer populations may require the removal of more deer than may be acceptable to many WMA hunters. On very poor quality sites, even a significant reduction in deer numbers may not produce improvements in deer quality. For this reason, some areas may not be suited for this type of management.

Six WMAs were under quality deer management (QDM) guidelines for the 2007-08 hunting season. These included Barbour, Black Warrior–Zone B, Covington, Freedom Hills, Lauderdale, and Lowndes WMAs. This was the first year for Black Warrior–Zone B to utilize mandatory antler restrictions for buck harvest. The other five WMAs have utilized antler restrictions for at least five years. Bucks must have at least 4-points on one antler to be legal for harvest on Black Warrior–Zone B. Bucks must have at least 3-points on one antler to be legal for harvest on the other five areas. Hunters also have more opportunity to kill antlerless deer on gun deer hunts on these WMAs than is available on most other WMAs. The five WMAs that

have utilized antler restrictions for at least five years have shown considerable improvements in the age structure of the antlered buck harvest since initiation of the QDM programs. This was the primary reason for implementing the antler restriction. Prior to the implementation of the antler restrictions, 1-½ year olds were the largest single age class in the annual buck harvest on all of the current QDM areas. For the 2007-08 hunting season, the overwhelming majority of the reported antlered buck harvest on these areas was comprised of 2-½ years old and older deer (Barbour 84%, Black Warrior–Zone B 73%, Covington 97%, Freedom Hills 96%, Lauderdale 91%, Lowndes 89%). The current management strategies on all six areas also should produce a higher percentage of adult bucks (2-½ years old and older) in the population, as well as a more balanced adult sex ratio, more intense rutting behavior, and many other traits characteristic of a healthy, balanced deer herd managed under QDM. Biologists on these areas will continue to collect biological data, as well as public opinion data, to monitor the status of the deer herd and the hunters using these five WMAs. These data are used to evaluate the effectiveness of current management practices used on the areas and aid biologists in making decisions to help achieve their long-term management objectives. As the public's demand for more WMAs managed for better quality deer becomes stronger, the Division of Wildlife and Freshwater Fisheries may decide to initiate QDM programs on other public hunting areas in the future. The majority of Alabama's WMAs will continue to be managed for maximum opportunity for buck harvest until that time.

Physically Disabled Hunting Areas:

Alabama's Physically Disabled Hunting Trail is a network of public and private recreational sites throughout the state providing accessible deer hunting opportunities for individuals with physical disabilities. The trail has been developed by the Division of Wildlife and Freshwater Fisheries of the Department of Conservation and Natural Resources in cooperation with a broad range of

sponsors. The sixteen areas open for deer hunting by physically disabled hunters during the 2007-08 hunting season provided 927 man-days of deer hunting opportunity, which was slightly down from the 2006-07 hunting season (995 man-days). Hunters killed 88 deer (45 bucks and 43 does) on these areas. Hunters killed one deer for every 10.5 man-days of hunting effort expended, which was slightly more than the 8.8 man-days of hunting effort per deer killed in 2006-07. The number of man-days of hunting effort expended, number of deer killed, and hunter success rates are summarized in Table XV.

Remarks:

Wildlife management areas provide a significant proportion of the deer hunting opportunity in Alabama. This year a 52% sample of the total deer harvest on WMAs was used in Tables XI, XII, and XIII. Project cooperators entered check station data on age, sex, weight, and antler development on bucks harvested from WMAs on computer and submitted a copy of these data to the project leader for analysis. Table XIV represents the number of male and female deer by age class used in the 52% sample collected from the various management areas. WMA totals, District totals, Statewide totals, and individual hunt results are listed in Appendices I, II, and III. Efforts to improve the accuracy of the tables and to expand our survey will continue when necessary to better manage the resource.

This study was a contribution of the Alabama Division of Wildlife and Freshwater Fisheries supported in part by funding from the Federal Aid in Wildlife Restoration Program, Project W-35, Study 2.
